

Solstice optimizes thermal growing season

Victor, Lizzie

August 2024

Outline

1. They say... blabla, it has to be solstice, fixed cue blabla
We agree, there is one of the hypotheses our paper considers and we don't believe our work invalidates it
We did not do frost damage (at all), we did not say solstice is suboptimal
Our results show solstice is optimal, but also show variation... just as their results do
2. Their results show across sites it starts near solstice, but ... actually before?
There will be variation, what amount of variation refutes their hypothesis?
They also show variation across sites, but not quantified to easily compare across latitude or with our results... do they have some predictions? Unclear what windows is predicted
And what spatial scale is expected?!
3. Maximizing synchrony is critical for max fitness under some economy-of-scale hypotheses...
There may be multiple ways to maximize synchrony, not just with solstice
Good science = multiple hypotheses!
